

# Project User Flow

So what does the user flow through your project look like? Use these boxes to work out the flow for where your user starts and where they can go. Each square represents a page in your site. Think about what actions (e.g. fill our form, click a link) lead to each other page. Keep it simple with labels and arrows for now. You'll get to wireframing pages next.

*\*Also, don't feel like you need to use every box. Use only what you need.*

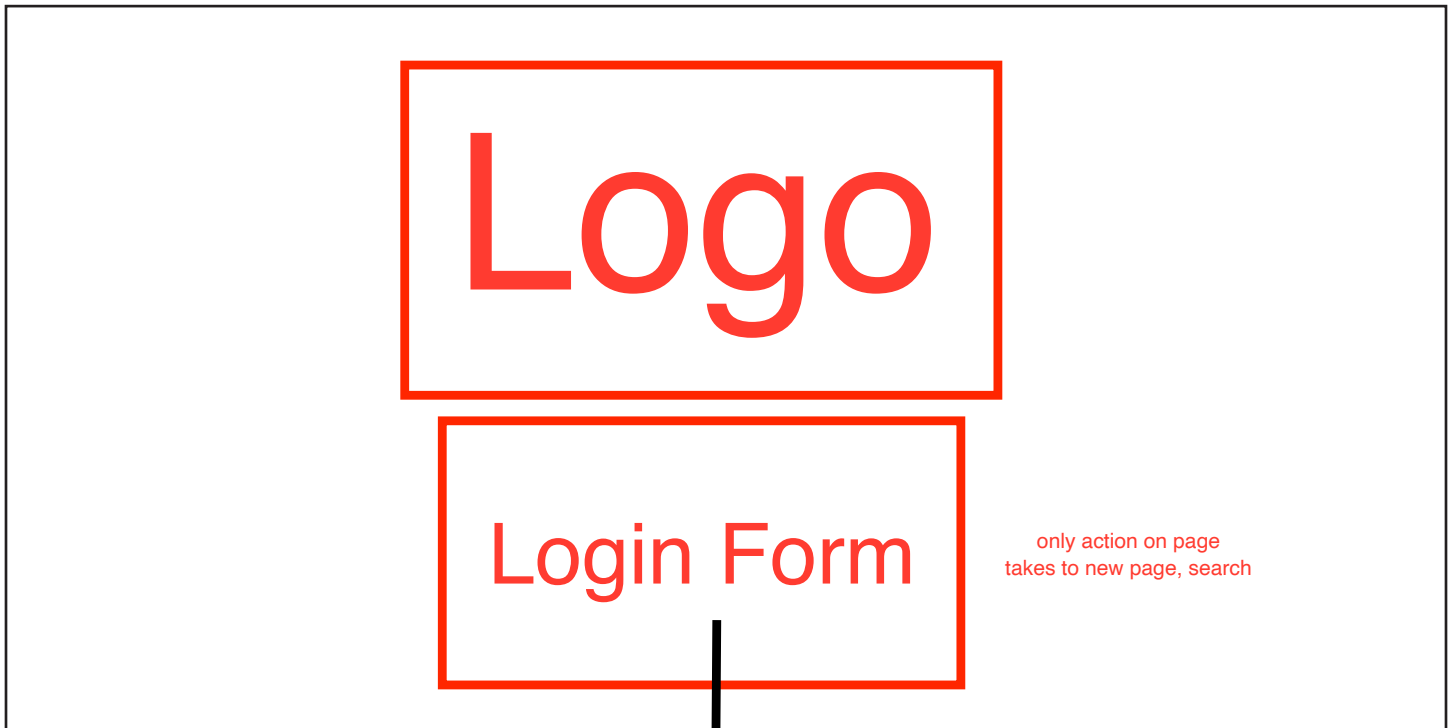

# Wireframes

Draw out your pages, and consider what elements need to exist on each page. These pages should reflect the user flow you've described on the previous page. Consider what information (text, images, etc.) is shown on each page. This information should help you identify what you will need in your database and together with your userflow will help you decide what you'll need to add or get from your database as you move from page to page.
